HACKATHON MIRAKL - UC 3

Rare AI talent is invisible through classic search. The signals exist — they're just not actionable yet.

LAURENT Louis, LESCURE Quentin, LIMEM Achraf, METCHAT Chahine

Our thesis: find talent environments before individual profiles.

Signal-first approach

Start from companies, teams, and market signals — not LinkedIn keywords.

Infer talent density

Infer talent concentration and latent seniority from public signals.

Recruiter-ready output

Generate recommendations, not raw data. Keep humans in control.

Human-in-the-loop by design — the system enhances TA judgment without replacing it.

From public signals to sourcing & strategic intelligence

TA Query → **Market Signals** → **Talent Pool Scoring** → **Candidate Intelligence** → **Competitor Brief**

OpenAI Agents
Reasoning & classification

Step 1 — Start from a recruiter question

QUERY

"Find Senior AI Engineers in France for Mirakl"

Scope: France · Paris / Bordeaux / Remote | Domain: AI, ML, LLM, RAG, Production AI

Query Expansion

The system expands the query into equivalent profiles and target environments.

Downstream Driver

This single input drives all downstream signal collection and scoring.

Natural Language

Recruiters ask a real question — no complex tool configuration required.

Step 2 — Capture and classify public market signals

Signal Types

Job posts, product news, engineering blog content, GitHub-style signals.

Action Labels

Act now · Watch · Ignore — so recruiters know what to prioritize instantly.

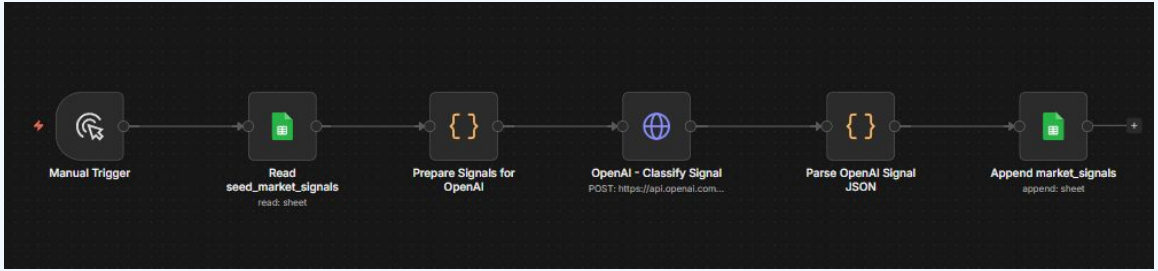
AI Interpretation

Each signal classified by type, relevance, confidence, and recommended TA action.

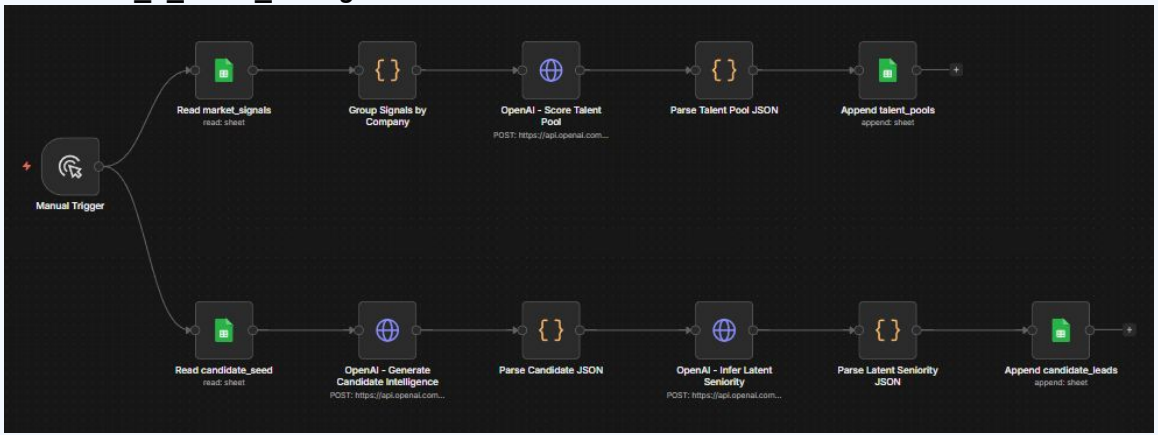
Intelligence Layer

Creates the raw intelligence layer that feeds talent pool scoring downstream.

workflow_1_collect_signals



workflow_2_talent_intelligence



Step 3 — Rank companies as talent pools

- Talent density
- France relevance
- Signal strength
- Mobility
- Mirakl fit

PRIORITIZED TALENT POOLS

- Dataiku
- Dust
- Criteo
- Contentsquare
- Doctolib

Smart Separation

Separates 'interesting company' from 'actionable sourcing opportunity.'

Sourcing Actions

Each company receives a recommended action. Recruiters know where to search first.

Step 4 — Generate recruiter-ready candidate intelligence

Lead Data

LinkedIn URL, company, title, fit score, and confidence level.

Why Detected

Each lead includes reasoning and a personalized outreach angle.

Latent Seniority

Detects seniority from tenure, stale profiles, and strong company context.

Outreach Draft

Recruiters get a first message draft, marked for manual validation.

Step 5 — Detect competitor hiring intent

COMPETITOR EXAMPLE

Dataiku

- Key signals summarized & talent strategy interpreted
- Predicted next hiring moves
- Concrete recommended actions for Mirakl TA

Strategic Radar

This turns Talent Acquisition into a strategic radar — not only a sourcing function.

Agent accelerates judgment. Human owns the relationship.

Agent does

- Collects and classifies market signals
- Scores talent pools by relevance
- Infers latent seniority
- Drafts outreach angles
- Generates competitor intelligence briefs

Human owns

- Validates identity and relevance
- Ensures compliance
- Decides timing and messaging
- Owns the relationship strategy
- Final outreach decision

MVP limits are clear — and productizable

Demo-seeded data

Candidate data must be validated before real outreach.

No direct LinkedIn scraping

Compliance-first: no scraping for legal and ethical reasons.

Signal gaps

Public signals can be incomplete, stale, or ambiguous.

Confidence scoring

Reduces overclaiming but does not remove uncertainty.

Next: connect ATS, Talent CRM, LinkedIn Recruiter export, compliant providers

FinOps: lightweight MVP, scalable by design

n8n Orchestration

Low fixed cost or self-hosted

Google Sheets / Airtable

Negligible MVP cost

OpenAI Usage

Classification & generation calls

MVP

€20 – €100/mo

Weekly runs, single role scope

PILOT SCALE

€150 – €500/mo

Multi-role, multi-company, higher refresh

Concrete value for Mirakl Talent Acquisition

- Build a France AI talent map for priority roles
- Monitor competitors: Dataiku, Dust, Criteo, Contentsquare, Doctolib
- Generate recruiter-ready shortlists with outreach angles
- Detect under-visible senior profiles earlier than classic sourcing
- Turn public market signals into weekly TA intelligence

A practical TA operating system: sourcing today, competitor foresight for tomorrow.
