AI Talent Sourcing Intelligence

LAURENT Louis, LESCURE Quentin, LIMEM Achraf, METCHAT Chahine

WHY

Mirakl must reach high-fit AI talent that is often invisible through public profiles alone.

HOW

Infer talent presence from company, team, and market signals — then turn signals into sourcing priorities.

WHAT

An agentic system that maps roles to talent patterns, detects talent pools, and guides TA action.

Rare AI talent is often not directly visible

The challenge is not finding public profiles — it is finding hidden high-fit talent pools.

Heterogeneous titles

Agent Builder, Applied AI, ML Engineer, GenAI — no standardised label for the same role.

Low public visibility

Many top AI engineers don't maintain an active LinkedIn, GitHub, or X presence.

Platforms are not enough

LinkedIn, GitHub and X alone cannot surface the full pool of relevant candidates.

Indirect discoverability

The best-fit candidates are discoverable indirectly — not visible directly on social platforms.

→ **The system must detect where these profiles are likely to be — not only who is publicly visible.**

From profile search to talent pool intelligence

We do not rely on profile visibility. We infer talent presence from market and team signals.

01

Identify likely talent environments

Map companies, teams and contexts where target profiles are most likely to exist

→

02

Detect signals of talent concentration

AI team growth, funding, layoffs, hiring freeze — signals that reveal talent mobility windows

→

03

Turn signals into outreach priorities

Convert insights into target company lists, team watch lists, and tailored approach angles

Company intelligence → **Team intelligence** → **Talent pool intelligence** → **Contact strategy**

How the system finds hard-to-see talent

Public Signals	Jobs · career pages · org charts · tech blogs · conference speakers · funding · layoffs · GitHub teams · hiring patterns
Company & Team Intelligence	Which companies and teams likely contain Mirakl-fit profiles?
Role Pattern Engine	Maps Mirakl target roles to equivalent titles, stacks, and team contexts
Talent Opportunity Engine	Detects probable talent pools, mobility windows, and sourcing priority
TA Recommendation Layer	Who to target first, where to search, and how to approach

Where to find a Senior AI Engineer

Even without a visible LinkedIn or GitHub footprint

Role Pattern

- AI agents · LLMs · RAG · MCP
- Python · LangChain / LangGraph
- Databricks · Spark · Airflow
- Production deployment focus

Likely Environments

- AI product / Applied AI / ML platform teams
- B2B SaaS scale-ups with mature AI stacks
- Companies industrialising agents or copilots
- Teams with recent AI infra / GenAI hires

Indirect Detection Signals

- Adjacent open roles under different title
- Conference talks · meetups · podcasts
- Engineering blog posts · changelogs
- Layoffs or reorg creating mobility windows

TA Action

- Prioritise target companies & teams first
- Launch pool-based outreach by source
- Frame message around product impact
- Then enrich individual profiles

We look for talent in ecosystems, not only in individual public profiles.
